Coursera Capstone project

For the issuance of

IBM Data Science Professional Certification

Submitted By- Shivanshu.T

Date of Submission-March, 2021

Report Content

- Introduction Section: The business problem to be solved by this project.
- <u>Data Section</u>: Describe Data requirements and Sources needed to solve the problem.
- Methodology section: Discussion of the results and finding of answer
- <u>Discussion section</u>: Discussion of observations noted and any recommendations.
- Conclusion

Introduction

Problem to be resolved:

How to find an apartment in Manhattan with the following conditions:

- Apartment with min 2 bedrooms
- Monthly rent not to exceed US\$7000/month
- Located within walking distance from a subway metro station in Manhattan

Data Section

Data Requirements

List of Manhattan (MH) neighborhoods with clustered venues established via Foursquare & Wikipedia.

List of subway metro stations in Manhattan with addresses and geo data.

List of apartments for rent in Manhattan area with information on neighborhood location, address, number.

Place to work in Manhattan (Park Avenue and 53rd St) for reference

Data Sources, Data Processing and Tools used

- Manhattan neighborhoods were obtained from Wikipedia and organized by Neighborhoods with geodatavia for mapping with Folium.
- List of Subway stations was obtained via Wikipedia, NY Transit web site and Google map,
- List of apartments for rent was consolidated from web-scraping real estate sites for MH. The geolocation data was found with algorithm coding.
- Folium map was the basis of mapping with various features to consolidate all data in ONE map whereone can visualize all details needed to make a selection of apartment

METHODOLOGY

The Strategy to find the answer:

The strategy is based on mapping the described data in section 2.0, in order to facilitate the choice of at least two candidate places for rent. The information will be consolidated in ONE MAP where one can see the details of the apartment, the cluster of venues in the neighborhood and the relative location from a subway station and from work place. A measurement tool icon will also be provided. The popups on the map items will display rent price, location and cluster of venues applicable.

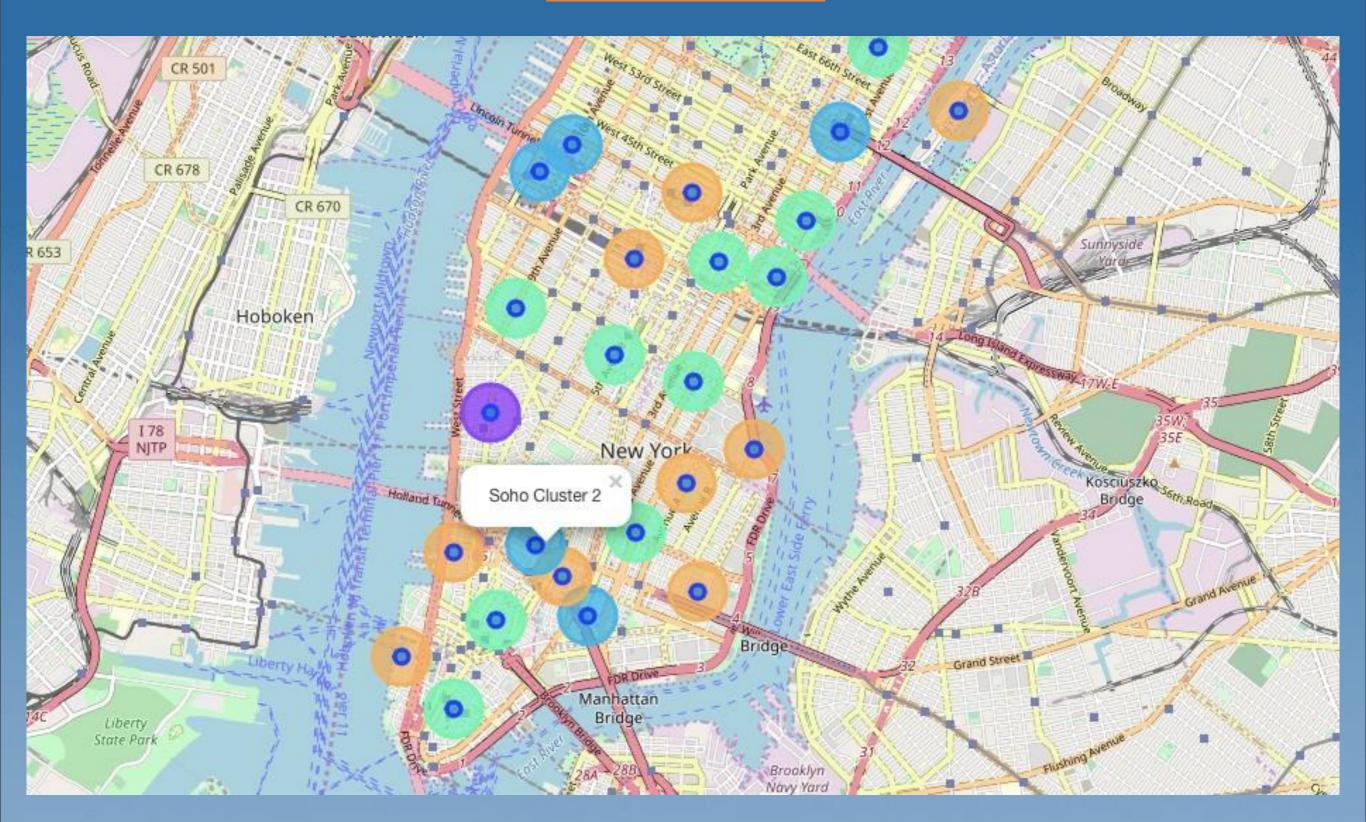

The Tools:

Web-scraping of sites is used to consolidate data-frame information which was saved as csv files for convenience and to simply the report. Geodata was obtained by coding a program to use Nominatim to get latitude and longitude of subway stations and also for each of (144 units) the apartments for rent listed.

Geopy_distance and Nominatim were used to establish relative distances. Seaborn graphic was used for general statistics on rental data.

Maps with popups labels allow quick identification of location, price and feature, thus making the selection very easy

FINAL APARTMENT SELECTION

Using the "one map" above, I was able to explore all possibilities since the popups provide the information needed for a good decision.

Apartment 1 rent cost is US \$7500 slightly above the budget. Apt 1 is located 400 meters from subway station at 59th Street and work place.

Apartment 2 rent cost is US \$6935, just under the budget. Apt 2 is located 60meters from subway station at Fulton Street, but I will have to ride the subway daily to work, possibly 40-60 min ride.

DISCUSSION

I feel this Capstone project presented me a great opportunity to practice and apply the Data Science

I have worked on this project to the best of my knowledge & skills.

I feel I have acquired a good starting point to become a professional Data Scientist and I will continue to explore by creating examples of practical cases.

CONCLUSIONS

I feel rewarded with the efforts, time and money spent. I believe this course with all the topics covered is well worthy of appreciation.

This project has shown me a practical application to resolve real situation that has impacting personal and financial impact using Data Science tools.
